

The Mapping Method

Mapping is a graphic representation of the information being presented that uses comprehension/concentration skills and relates each factor or idea to the others.

This format can be used in conjunction with both the Cornell and outline method or as a study guide by rewriting notes already taken.

An advantage of this format is that it can help you to visually see how the information is connected that is different from the Cornell or outline methods. Editing is easy by adding numbers, marks, or color codes (see callout).

Can be used as a study guide by creating flashcards, covering lines, or pieced together into a larger table or structure
